Notes for Typical Application Circuits:

1. For the series regulator applications, add a compensation capacitor  $C_1$  between CATHODE and REF is strongly recommended to improve the stability of output voltage.
2. Set  $V_o$  according to the following equation:  $V_o = V_{REF}(1 + R_1/R_2) + I_{REF} \times R_1$ .
3. Choose the Value for  $R_B$  as below:
  - (1). The maximum limit for  $R_B$  should be such that the cathode current ( $I_K$ ) is greater than the minimum operating current (0.5mA) at  $V_{IN(MIN)}$ .
  - (2). The minimum limit for  $R_B$  should be such that the cathode current ( $I_K$ ) does not exceed 100mA under all load conditions, and the instantaneous turn-on value for  $I_K$  does not exceed 120mA.
